Response:

I used animating entry effects.

Found here on web.dev website: <https://web.dev/blog/baseline-entry-animations?hl=en>

Explanation: It provides a way to apply animations on elements that are initially on "display: none". Before, the elements would just pop into existence.

Implementation: I used it in the settings dialog box. It pops in the animation from the bottom. Ironically, there is no clean feature to animate into something that is display none.
